Hexagon | NovAtel is pleased to announce their Waypoint post-processing software now includes built-in support for HxGN SmartNet, the world's largest GNSS reference station network. HxGN SmartNet offers reliable coverage and local support from thousands of Real-Time Kinematic (RTK) reference stations worldwide, providing centimetre-level accuracy necessary for machine control and automation, surveying and asset mapping.

With Waypoint post-processing software's new built-in HxGN SmartNet support, users requiring highly accurate post-mission measurements have a simpler process to integrate precision RTK corrections and RINEX data into their surveys. Waypoint software users with a valid HxGN SmartNet subscription can enter their login credentials in their *Preferences* menu to integrate their services.

Along with HxGN SmartNet support, features now available in the 8.90.4416 release include:

- Local license manager interface for offline activation and offline management of Waypoint software licenses
- Improved support for users using PPP corrections to calculate local base station coordinates and automate differential processing of short surveys

A full listing of all changes is available in the version history documents on <https://novatel.com>
